Your Name
Today's Date

Original	Fixed Threshold	Noisy Threshold
<img>	for each pixel if val < **128** val = 0 else val = 255	for each pixel if val < **RAND** val = 0 else val = 255
Ratio	Count the black pixels. Count the white pixels.	black * 1.0 / (black + white) white * 1.0 / (black + white)
<elvis>		Do **not** pick a new random number for each and every pixel location. Instead, pick **64-by-64** at the start and then reference back to the corresponding value. As if the image were **tiled**. (r,c) = (row % 64, col % 64) ********** Use your student ID # as the seed value. **********
Ratio	black 0.464935 white 0.535065	...depends on your **seed** value ...which depends on your ID #
